Smooth S^1 -action and bordism

Akio Hattori

This talk is based on a work which is done in part jointly with H. Taniguchi. Details will appear elsewhere.

Let G be a compact Lie group and \mathcal{F} and \mathcal{F}' be families of subgroups of G such that $\mathcal{F}' \subset \mathcal{F}$. Following Conner-Floyd I call an effective action of G on a manifold M $(\mathcal{F}, \mathcal{F}')$ -free if $G_x \in \mathcal{F}$ for all $x \in M$ and $G_x \in \mathcal{F}'$ for all $x \in \partial M$. When $F' = \emptyset$ then ∂M must be empty. The bordism group $\Omega_n(G; \mathcal{F}, \mathcal{F}')$ of all orientation preserving $(\mathcal{F}, \mathcal{F}')$ -free smooth G -actions on compact smooth manifolds is defined as follows. (M, ψ) and (M', ψ') are bordant iff there is (W, Ψ) such that

$$\partial W \supset M \cup -M, \quad \Psi|_M = \psi, \quad \Psi|_{M'} = \psi',$$

Ψ is \mathcal{F} -free and $\Psi|_{\partial W - (M \cup M')}$ is \mathcal{F}' -free. There is an exact sequence

$$\cdots \longrightarrow \Omega_n(G; \mathcal{F}') \xrightarrow{i_*} \Omega_n(G; \mathcal{F}) \xrightarrow{j_*} \Omega_n(G; \mathcal{F}, \mathcal{F}') \xrightarrow{\partial_*} \cdots.$$

Similarly the U-bordism group $\Omega_n^U(G; \mathcal{F}, \mathcal{F}')$ is defined where we consider U-manifolds and U-structure preserving actions.

Now consider the case $G = S^1$. We set

$$\mathcal{F}_\ell^+ = \{Z_k \mid k \leq \ell\} \quad \text{and} \quad \mathcal{F}_\ell^+ = \mathcal{F}_\ell \cup \{S^1\}.$$

Theorem. The sequences

$$0 \rightarrow \Omega_n^U(S^1; \mathcal{F}_{\ell-1}^+) \xrightarrow{i_*} \Omega_n^U(S^1; \mathcal{F}_\ell^+) \xrightarrow{j_*} \Omega_n^U(S^1; \mathcal{F}_\ell^+, \mathcal{F}_{\ell-1}^+) \rightarrow 0$$

$$0 \rightarrow \Omega_n(S^1; \mathcal{F}_{\ell-1}^+) \rightarrow \Omega_n(S^1; \mathcal{F}_\ell^+) \rightarrow \Omega_n(S^1; \mathcal{F}_\ell^+, \mathcal{F}_{\ell-1}^+) \rightarrow 0$$

are split exact ($1 < \ell$).

Geometrical contents of the theorem are as follows. For the sake of simplicity hereafter I restrict myself only to U-cases.

Consider a triple (X, V, ψ) where

X is a compact U-manifolds,

V is a complex vector bundle over X ,

ψ is an effective S^1 -action on V by isomorphisms.

Let

$$H = \{g \mid g \in S^1, \psi(g)x = x \quad \forall x \in X\}.$$

If $H \neq S^1$ then $H = \mathbb{Z}_\ell$ for some ℓ . We say that the action ψ is of order ℓ . In that case there is a unique S^1 -action ϕ on X such that

$$\psi(g)x = \phi(g)^\ell x.$$

Definition. ψ is strictly \mathcal{F}_ℓ^+ -free ($\ell > 1$), iff

- 1) ψ is of order ℓ ,
- 2) the action ϕ (as above) is \mathcal{F}_1^+ -free,
- 3) ψ restricted on $V - X$ is $\mathcal{F}_{\ell-1}$ -free.

If (X, V, ψ) is strictly \mathcal{F}_ℓ^+ -free then $(D(V), \psi)$ is $(\mathcal{F}_\ell^+, \mathcal{F}_{\ell-1})$ -free hence $(\mathcal{F}_\ell^+, \mathcal{F}_{\ell-1}^+)$ -free where $D(V)$ is the disk bundle of V . The bordism group $B_n^U(S^1; \mathcal{F}_\ell^+) = \{[X, V, \psi]\}$ is defined in an obvious way where ψ is strictly \mathcal{F}_ℓ^+ -free and

$$\dim X + 2 \dim_{\mathbb{C}} V = n.$$

Proposition.

$$B_n^U(S^1; \mathcal{F}_\ell^+) \cong \Omega_n^U(S^1; \mathcal{F}_\ell^+, \mathcal{F}_{\ell-1}^+)$$

in a natural way.

Moreover the homomorphism j_* is transformed into the "fixed point homomorphism for \mathbb{Z}_ℓ "

$$\Omega_n^U(S^1; \mathcal{F}_\ell^+) \longrightarrow B_n^U(S^1; \mathcal{F}_\ell^+)$$

in the following sense.

Let (M, ψ) be an \mathcal{F}_ℓ^+ -free action. Then there are 2 kinds among the components X of the fixed point set of $\psi(\mathbb{Z}_\ell)$.

1st kind: $G_x = \mathbb{Z}_\ell$ for some $x \in X$.

2nd kind: $G_x = S^1$ for all $x \in X$.

Proposition. j_* is transformed into the homomorphism given by

$$[M, \psi] \longmapsto \sum [X_i, v_i, \psi]$$

where X_i runs over the components of the 1st kind of the fixed point set of $\psi(\mathbb{Z}_\ell)$ and v_i is the normal bundle of X_i in M .

In the rest of this talk I shall give a splitting

$$B_n^U(S^1; \mathcal{F}_\ell^+) \longrightarrow \Omega_n^U(S^1; \mathcal{F}_\ell^+), \quad 2 \leq \ell,$$

which looks very simple.

First consider the case $\ell = 2$. Since ψ is free on $V - X$, $S(V)/\psi = \mathbb{P}_\psi(V)$ is a smooth manifold. Let W_ψ be the disk bundle of $S(V) \longrightarrow \mathbb{P}_\psi(V)$ and

$$\mathbb{P}_\psi(V \times \mathbb{C}) = D(V) \cup W_\psi.$$

Clearly the action ψ extends on $\mathbb{P}_\psi(V \times \mathbb{C})$. The fixed point set of $\psi(\mathbb{Z}_\ell)$ equals

$$X \cup \mathbb{P}_\psi(V)$$

where X is of the 1st kind and $\mathbb{P}_\psi(V)$ is of the 2nd kind. Hence

$$B_*^U(S^1; \mathcal{H}_2^+) \longrightarrow \Omega_*^U(S^1; \mathcal{H}_2^+)$$

$$[X, V, \psi] \longmapsto [\mathbb{P}_\psi(V \times \mathbb{C}), \psi]$$

is a splitting for j_* .

For general ℓ we construct a strictly \mathcal{H}_2^+ -free S^1 -action ψ on V which covers φ^2 and commutes with ψ as follows. The group \mathbb{Z}_ℓ acts on V by automorphism (via ψ). Hence it gives a decomposition

$$V = \sum V(\ell_i)$$

where

$$\psi(g)v = g^{\ell_i} v, \quad g \in \mathbb{Z}_\ell, \quad v \in V(\ell_i).$$

The integer ℓ_i is determined modulo ℓ so that we may assume

$$0 < \ell_i < \ell,$$

since ψ is strictly \mathcal{H}_ℓ^+ -free. I shall write this as

$$\psi(g) = \psi'(g)^{\ell_i}, \quad g \in \mathbb{Z}_\ell, \quad \text{on } V(\ell_i),$$

where $\psi'(g)$ is scalar multiplication. Consider the S^1 -action on $V(\ell_i)$ given by

$$g \longmapsto \psi(g) \psi'(g)^{-\ell_i}.$$

There is a unique ψ'' on $V(\ell_i)$ such that

$$\psi''(g)^\ell = \psi(g) \psi'(g)^{-\ell_i}.$$

ψ'' covers φ and hence can be summed up:—

$$\psi''(g) \sum v_i = \sum \psi''(g) v_i, \quad v_i \in V(\ell_i).$$

Define

$$\psi_1(g) = \psi''(g)^2 \psi'(g)$$

ψ_1 commutes with ψ . Set

$$\begin{cases} \mathbb{P}_\psi(V) = S(V) / \psi_1 \\ \mathbb{P}_\psi(V \times \mathbb{C}) = D(V) \cup W_\psi \end{cases}$$

as before. ψ is extended over $\mathbb{P}_\psi(V \times \mathbb{C})$.

The following lemma can be checked by calculations.

Lemma. The action ψ on $\mathbb{P}_\psi(V \times \mathbb{C})$ is $\mathcal{H}_{\ell-1}^+$ -free outside
of X .

It follows that

$$\begin{aligned} t_P : B_*^U(S^1; \mathcal{H}_\ell^+) &\longrightarrow \Omega_*^U(S^1; \mathcal{H}_\ell^+) \\ [X, V, \psi] &\longmapsto [\mathbb{P}_\psi(V \times \mathbb{C}), \psi] \end{aligned}$$

is a splitting for j_* .

Corollary.

$$\Omega_*^U(S^1) = \Omega_*^U(S^1; \mathcal{H}_1^+) \oplus \sum_{2 \leq \ell} t_P(B_*^U(S^1; \mathcal{H}_\ell^+)).$$

I want call $\mathbb{P}_\psi(V)$ and $\mathbb{P}_\psi(V \times \mathbb{C})$ twisted complex projective space bundle although they are not bundles in the usual sense.

Let me remark the following:

Proposition. Let $\dim_{\mathbb{C}} V = k$. $F = \text{Fix } \varphi \subset X$.

There is a map

$$\pi : \mathbb{P}_\psi(V) \longrightarrow X/\varphi$$

which is

a \mathbb{CP}^{k-1} -bundle on $F = F/\varphi \subset X/\varphi$,

an $\mathbb{R}P^{2k-1}$ -bundle on X/\mathfrak{g} - F.

This construction $P_\psi(V \times \mathbb{C})$ can be used to give an elementary proof of Kooniowski's and Atiyah-Singer's formula.
